

**JUNIPER SPITTLEBUG**  
*Clastoptera juniperina*

- Natural range -** Unknown, probably western North America
- Species affected -** Junipers
- Type of damage -** Feed on succulent shoots and foliage
- Symptoms -** Clusters of spittle-like froth are found on the shoots. The froth surrounds the nymphal stage of the insect.
- Importance -** This insect can be common on ornamental junipers.
- Remarks -** This insect is not an aphid or scale but is related and sucks plant juices in the same manner as do the aphids and scales.
